

Dus-Tek™

Dust Collector Attachment

The Dus-Tek utilizes gravity along with the suction of the dust collector to remove dust from a lathe or handpiece. This feature will make your dust collector much more efficient as compared to "fishmouth" type attachments. An air movement of at least 100 CFM is recommended for the Dus-Tek.

INSTRUCTIONS

- 1) Unpack the Dus-Tek and make sure the following items are included:**
 - 1- Dus-Tek
 - 1- inlet screen
 - 1- 3 inch flex hose (2 ft.)
 - 1- flat shield (front)
 - 1- bent shield (rear)

- 2) Remove the protective paper from the front and rear shield by slowly peeling it off.**

- 3) Install the shields and adjust the phillips head screw if necessary. The screw should be just tight enough so that the shields can be removed easily.**

- 4) Connect the white flex hose from the Dus-Tek to the dust collector and place the inlet screen on the top of the unit.**
